

MEET THE HOUNDS

SIRIUS

Agent Group Tagging

Sirius Hound · Category: Ops

“Segmentation as clean as your deployment.”

The brightest star in the pack — Sirius shepherds coordinated groups of hounds with clean structure.

THE PROBLEM

Your Tenable agent groups already describe how the estate is organized — but that structure is invisible everywhere tags are consumed. Scans, reports, automation, and every downstream hound work from tags, and when tags drift out of sync with deployment reality, segmentation quietly stops meaning anything.

WHAT IT DOES

Sirius tags assets by their Tenable agent group, turning deployment structure into clean, queryable tag segmentation. Group membership becomes usable structure everywhere tags are consumed — one mapping, consistently applied, kept current.

KEY CAPABILITIES

- **Agent-group → tag mapping** — your deployment's own organization becomes tag structure, automatically and consistently. Segmentation matches operational reality without inventing a taxonomy or holding a single design meeting.
- **Clean segmentation** — group-based asset populations ready to scope scans, filter reports, and drive downstream agents. One mapping, consumed everywhere tags are.
- **Gated writes** — even routine structural tags are proposed, human-approved, and logged. Nothing writes silently.

HOW IT WORKS

Sirius reads agent-group membership from your Tenable data in the local navi.db and proposes matching tags. All writes are proposed, human-approved, and logged.

WHY IT'S DIFFERENT

- **Structure you already maintain** — no new taxonomy to invent; agent groups become tags with zero design meetings.
- **Reliable segmentation for the whole pack** — every other hound's group-scoped work stands on Sirius's tags.
- **Gated like everything else** — even routine structural tags are proposed and approved, never silent.

PROOF POINTS

- In a reference environment of 268 assets, Sirius's group tags are the segmentation backbone the pack's producers and the Contract build on — structure laid down once, consumed everywhere.

Illustrative demo-lab context — not a guarantee. Tags propagate to the Tenable UI/API on Tenable's schedule.

WORKS BETTER WITH

Sirius pairs with **Garmr** — structure laid down, clutter swept out — and feeds **Covenant**, which keeps group tagging current on the Contract's schedule.

WHO IT'S FOR

Security operations teams who own the tag estate, and anyone who wants scans and reports scoped by how the deployment is actually organized.

CALL TO ACTION

Let Sirius lay the structure down — the whole pack navigates by the brightest star.
