

MEET THE HOUNDS

CHARON

EOL / Unsupported Tagging

Charon Hound · Category: Threat & Exposure

“Tag the software that can no longer be saved.”

The ferryman — Charon finds the software whose time has passed, and marks it for the crossing: isolate or replace.

THE PROBLEM

End-of-life software is un-patchable risk hiding in the estate. No vendor fix is coming — every new CVE against it is permanent exposure. Yet EOL systems rarely announce themselves; they sit quietly in inventory, indistinguishable from healthy software until an auditor or an attacker finds them.

WHAT IT DOES

Charon tags every asset running unsupported or end-of-life software, so you can isolate or replace it deliberately instead of discovering it in an incident. It detects EOL two ways — lifecycle text in your findings, and Mimir's endoflife.date enrichment — and turns the result into gated, routable tags.

KEY CAPABILITIES

- **EOL detection from lifecycle text** — finds the “no longer supported” evidence already sitting in your scan findings, surfacing unpatchable software with zero new data collection.
- **endoflife.date enrichment via Mimir** — an independent lifecycle feed catches products whose EOL status the scanner never flags. Two detection paths, unioned, each covering the other's blind spot.
- **Gated EOL tagging** — the unsupportable population becomes visible, taggable, and routable — approved by a human before any write lands.
- **Isolate-or-replace worklist** — a bounded, evidence-backed modernization queue that turns “we should deal with legacy someday” into a prioritized plan with names on it.

HOW IT WORKS

Charon runs against the local navi.db built from your Tenable data — lifecycle signals in the findings, unioned with Mimir's endoflife.date-enriched product map. All writes are proposed, human-approved, and logged.

WHY IT'S DIFFERENT

- **Two detection paths, unioned** — scanner lifecycle text and an independent lifecycle feed catch what either alone misses.
- **EOL as attack-path evidence** — Charon's tags feed Fenrir, where unpatchable software becomes a scored foothold, not a footnote.
- **Gated, reviewable writes** — Charon proposes tags; a human approves.

PROOF POINTS

- In a reference environment of 268 assets, Charon works the same product map Mimir reconciled from **~28,700 software rows** and **~43,700 CPE rows** — every EOL hit traceable to its lifecycle evidence.

Illustrative demo-lab context — not a guarantee. EOL detection depends on inventory coverage; blind or uncredentialed hosts are called out, not hidden.

WORKS BETTER WITH

Charon is unioned with **Mimir** (lifecycle enrichment), feeds **Fenrir** (EOL software as foothold evidence in attack paths), and drives **Anubis** so unpatchable assets carry criticality that reflects the risk.

WHO IT'S FOR

Vulnerability management teams carrying risk they can't patch away, and IT modernization owners who need a prioritized, evidence-backed replacement queue.

CALL TO ACTION

Ask Charon what's already past saving — then choose the crossing on your terms.
